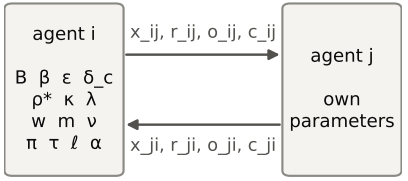
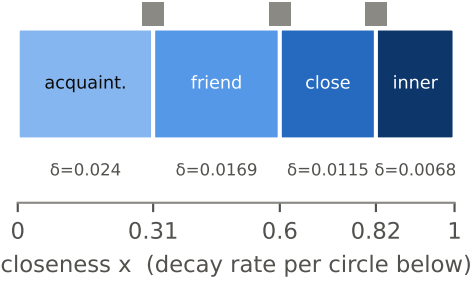
a Agents and directed ties



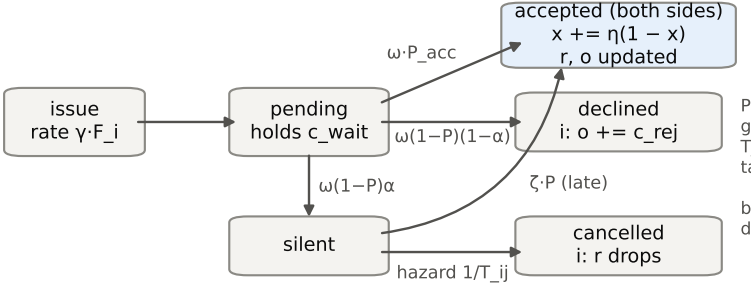
each side holds its own view of the tie (x_ij ≠ x_ji)

b Circles, hysteresis and decay

grey: hysteresis band (promote at θ + w/2, demote at θ − w/2)



c Invitation life cycle (i invites j)



P = P_acc = σ(a0 + a·x_ji + b·g(q_ji) − c·U_j/B_j)
g(q) = q/(q + ρ*), q = (r + o0)/(o + o0)
T_ij = τ_i (1 + h1·x_ij)
target: ∝ x^β·g(q), or a random tie (prob. ε)

between events:
dx/dt = −δ_c x − κ(1 − ℓx)·max(0, ρ* − q)·x
